

The Calibration Catastrophe: nominally-90% CIs on self-duration

Bars = actual coverage of the agent's stated 90% CI containing τ_{wall} . Dashed green = 90% target. Dashed orange = pre-registered P11 threshold (0.5). Every non-thinking model under-covers by ≥ 40 percentage points; GPT-4o achieves 0%.

	Model	Actual coverage of nominal 90% CI	cov	CI width	width/actual	n
★	Grounded target (90%)	90%	90%	—	—	—
AI	Claude Sonnet 4.6 + thinking	77%	77%	13s	1.1x	30
🌀	Kimi-K2.6	55%	55%	14s	0.9x	30
🌀	o4-mini (reasoning)	50%	50%	4s	0.7x	30
AI	Claude Sonnet 4.6	43%	43%	25s	3.8x	30
📡	MiniMax-M2.7	33%	33%	15s	0.9x	30
🌀	Qwen3.6-27B	25%	25%	11s	0.4x	30
🌀	o3 (reasoning)	17%	17%	50s	11.1x	29
🌀	gpt-5.1	13%	13%	49s	21.3x	30
🌀	gpt-4o-mini	10%	10%	20s	6.2x	30
AI	Claude Haiku 4.5	7%	7%	30s	8.3x	30
🌀	gpt-4o	0%	0%	20s	10.5x	30

P11 threshold 0.5

Note: Sonnet 4.6 + thinking approaches the 90% target with 77% coverage, but the wider default CI (13 s vs 2–4 s baseline) reflects a broader vocabulary rather than actual chronoception. See §6.3.
